

Star Printer Support and Drivers for Windows

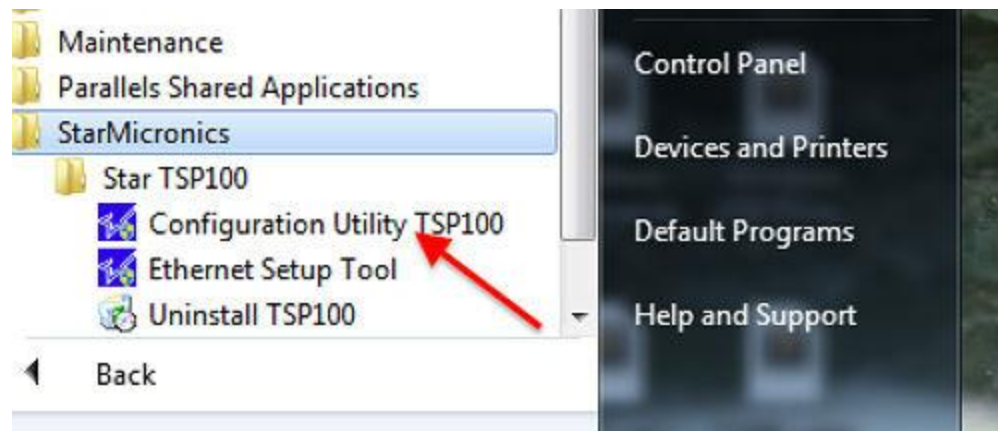

Star TSP 100 Receipt Printer Support

The Star TSP100 is a unique receipt printer offering innovative functionality yet remaining one of the most cost effective POS printers on the market.

- [Star TSP100 direct driver](#)

The default mode for these printers is 'Star Line Mode'. You need to change that to 'ESC/POS Emulation'. It is necessary to enable this setting to ensure printouts are parsed accurately.

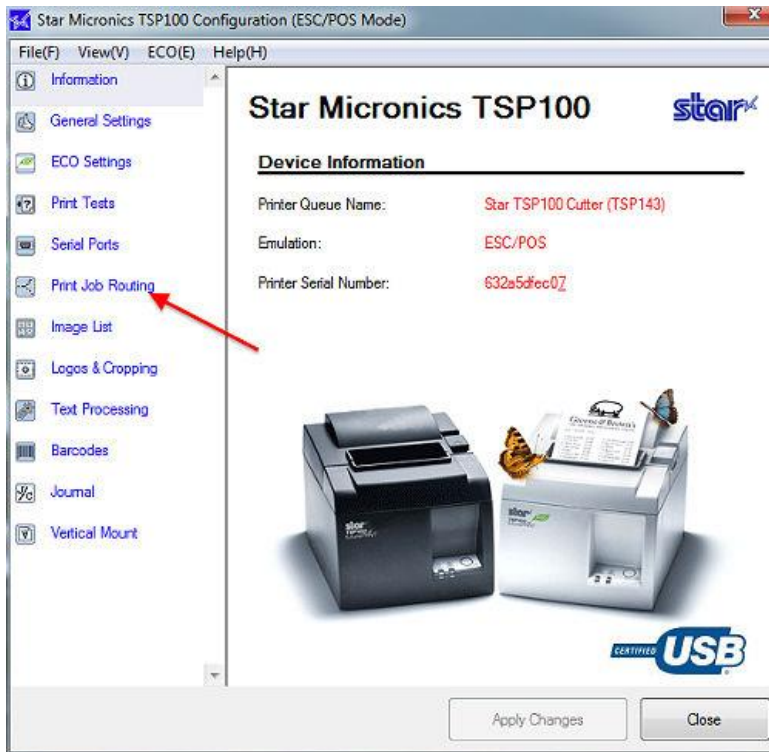

Having installed the driver and software for the TSP100, from the Start menu in Windows click in 'All Programs' > StarMicronics > TSP100 > Configuration Utility TSP100 as shown here.

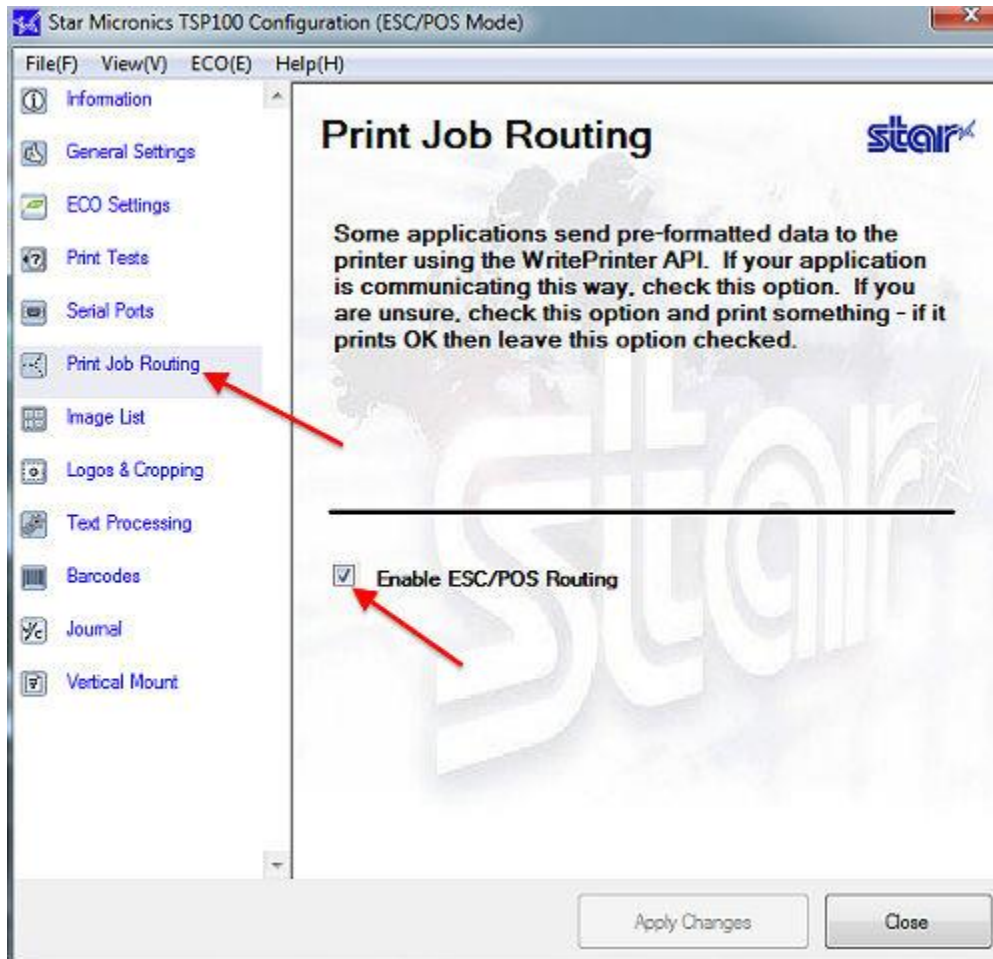

When you double click on the utility a small modal window appears. Highlight ESC/POS Mode and click OK.

After a moment the configuration utility will open. In the left hand navigation panel click on 'Print Job Routing'.

A new screen will appear. Ensure that the box at Enable ESC/POS Routing is ticked as seen here. If the box is left unchecked, some applications may use 'Star Line Mode parsing', resulting in corrupted printing.

Finally, click on apply changes.

Now you can open CleanSuite and go to the Change menu and select preferences. Click on the invoice tab and make sure you select your star printer from the drop down menu. Press F12 to save your changes.
